1 **Inequalities related to weighted averages**

2 So far, it is quite natural to hypothesize that the value of
3 ϵ, γ -trimmed mean should be monotonically related to the
4 breakdown point in a semiparametric distribution, since it is
5 a linear combination of quantile averages as shown in Section
6 ???. Analogous to the γ -orderliness, the γ -trimming inequality
7 for a right-skewed distribution is defined as $\forall 0 \leq \epsilon_1 \leq \epsilon_2 \leq$
8 $\frac{1}{1+\gamma}$, $TM_{\epsilon_1, \gamma} \geq TM_{\epsilon_2, \gamma}$. γ -orderliness is a sufficient condition
9 for the γ -trimming inequality, as proven in the SI Text.
